Fatent No. 6551795
GENERAL INFORMATION:
TITLE OF INVENTION: ALGORITHM AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US 60/074,788
FRIOR APPLICATION NUMBER: US 60/074,788
FRIOR APPLICATION NUMBER: US 60/074,788
FRIOR FILING DATE: 1998-02-18
FRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 33082
LENGTH: 460
            APPLICANT: Marc J. Rubenfield et al.

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a proliferation of a cell. Also included are:

(2) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity against a biological pathway of required for proliferation, or that inhibits cellular proliferation of sequired for proliferation, or that inhibits cellular proliferation of identifying a gene required for cellular proliferation or the biological compound a activity; (1) acidlure of compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent product is overexpressed or underexpressed; (12) determining the extent of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the collection of strains; or (13) identifying the target of a compound that inhibits are useful for identifying proteins or screening for homologues nucleic acids are useful for content of an organism. The antisense modeled acids required for an discovery programs or for general endecades and acids required for an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   drug discovery programs, or for screening homologous mucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense nucleic acids, useful for identifying proteins or scre

Corn starch branching enzyme IIb (SBEIIb) (AAW19212) is an isoform of starch branching enzyme that shows higher rates of branching with amylopectin rather than amylose as subscrate. A cDNA inser (AAR69229) in plasmid clone pBR240 that expresses SBEIIb has been used as a starting point in the assembly of DNA constructs (see also AAR69730, AAR69736-37) designed to achieve suppression of SBEIIb expression in transgenic corn plants, and thereby to produce novel starches that have properties beneficial in food and industrial applications Starch branching enzyme IIb; SBEIIb; corn; maize; antisense; amylopectin; transgenic plant; pBB240. Transgenic corn in which grain derived starch fine structure is controlled - specifically branch chain distribution of amylopectin, useful in preparation of thickened foodstuff. 67.9%; Score 36; DB 2; Length 799; 85.7%; Pred. The invention is useful in developmental biology and in elucidating call signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeutics and pharmaceutical faruge. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-BABT2017). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bifidobacterium longum NCC2705; Bifidobacterium; bacterial; antidiarrheic; antibacterial; inhibitor of Salmonella; detection; identification; lactic acid bacterium; diarrhoea; pathogenic bacteria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bifidobacterium longum NCC2705 ORF amino acid sequence SEQ ID NO:732.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABB65619
```

```
The present invention describes a polynucleotide (I) comprising a sequence of a Bifidobacterium genome selected from the nucleotide sequences given in ABOB1842 and ABOB1843, or a sequence exhibiting at least 10% identity or which hybridises with the sequences given in ABOB1842 and ABOB1843, or a sequence exhibiting at least 10% identity or which hybridises with the sequence exhibiting at Lagas 10% identity or which hybridises with the sequence given in ABOB1842 and ABOB1843. Also described is a polynucleotide (II) encoding a cut in ABDE5258 to ABDE6354 ligated in frame to a polynucleotide encoding a cativities, and can be used as an inhibitor of Salmonolla. (I) (which is a probe) is useful for the detection and/or identification of Bifidobacterium longum NCC2705 (COVM I-2618) can be used for preventing and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected commulk, yogurt, curd, cheese, fermented milks, milk based fermented products, ince-creams, fermented cereal based products, milk based composition conducts, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral supplement, wet cral supplement, dry tube feeding or wet tube feeding.

(I) is useful in DNA arrays or chips to carry out analysis of the still decided and composition of a pharmaceuticum, in the batch of a production of a pharmaceutical composition of a sphesion of the Biffidobacterium gene. ABOB1841 to ABOB1850 represent a supplement.
                                                                                                                                                                                                                                                                                                                                            Novel polynucleotide comprising Bifidobacterium genome sequence useful as a probe or primer for detecting and/or identifying Bifidobacterium longum in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bifidobacterium related nucleotide sequences given in the Sequence fisting from the present invention but not mentioned further within the specification. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0,

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGK) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed can be useful in gene therapy techniques to restore normal cativity of (II) as useful in gene therapy techniques to restore normal cativity of (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, formsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. ABG00010-ABG30377 represent novel human diagnostic mino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MPO at the printed specification, but was obtained in electronic format directly from MPO at

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic partent did not annear in the printing result in the printing in the printing and the printing and products dependent on DNA and amino acid sequences of the invention. Note: The sequence other this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

WPI; 2003-381789/36. N-PSDB; ACF64530. New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

Example 1; SEQ ID NO 20436; 1481pp; English

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

concoding a Propionibacterium acnes protein. The invention also relates to encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a colymucleotide of the invention; and propertied and invention; and propertied of the invention; and invention; and an isolated T cell population comprising T cells prepared to invention; at this method; a vaccine composition (comprising P. acnes polypeptides, polymorptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polymptide; a method and xit continuing the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a continuing the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a continuing the presence or absence of P. acnes in a proteins. T cell populations or antigen-presenting cells that express the polymorphic or antigen propertied for diagnosing, preventing or treating acnes to protein. The p. acnes polypeptides, polymorphicides, in the polymorphic or antigen-presenting cells that express the polymorphic or antigen-presenting cells in a necestary or for stimulating an immune response specific for a P. acnes protein. The polymorphic can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the sequence represents applyapented predicted to be encoded by an ORF (open creating frame) contained within the P. acnes polymorphic or active contained within the P. acnes polymorphic or the printed specification, but was obtained in electronic format directly contained with a polymorphic or and the printed specification, but was obtained in electronic format directly contained between the printed specification, but seed as processed to the printed processed to the printed processe

Krebs B; Hirth-Dietrich C, Kraft S, Pan C, Knorr AM, Schauer M,

WPI; 2003-129114/12. N-PSDB; ABZ74842 New human anti-TIMP-1 (tissue inhibitor of metalloprotease-1) antibodies, for diagnosing or ameliorating the symptoms of a disorder in which TIMP-1 is elevated, e.g. liver fibrosis, benign prostate hypertrophy or lung cancer.

Claim 21; Page 135-136; 228pp; English.

The invention relates to a novel purified preparation of a human antibody, which binds to a tissue inhibitor of metalloprotease-1 (TIMP-1) and inbody, which binds to a tissue inhibitor of metalloprotease-1 (TIMP-1) and neutralises a matrix metalloprotease (MMP)-inhibiting activity of TMP contains a variable heavy chain (VHC) DR3 region and a cariable light chain (VLC) DR3 region. An antibody preparation of the continuity of a TIMP-1 it is especially useful for decreasing an MMP-inhibiting activity of a TIMP-1. It is especially useful for ameliorating the symptoms of a disorder in which TIMP-1 is elevated e.g. liver fibrosis, alcoholic liver disease, cardiac fibrosis, and contary syndrome, lupus nebritis, glomerulosclerotic renal disease, idiopathic pulmonary fibrosis, benign prostate hypertrophy, lung cancer or colon cancer. The antibody is also useful for detecting a TIMP-1 in a test preparation, or in diagnosing a disorder in which a TIMP-1 is elevated. The sequences shown in ABR01460-ABR01501 represent the light chain regions of a human anti-TIMP-1 antibody of the invention

Propionibacterium acmes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Example 1; SEQ ID NO 20436; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypercosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies only peptides may be used as antigens in the production of antibodies of the refore treat P. acnes proteins. The antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for the print of the printed specification, but was ftp.wipo.int/pub/published_pct_sequences

```
and the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due to dervironmental conditions, including abiotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or biotic stress such as pathogen attack, to modulate e.g. enhance crop yields, and attenuate plant architecture, plant quality traits, plant reproduction and seed development, endoreduplication in storage cells, storage tissues and/or storage organs of plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to screen for naturally coccurring CCP substrates. The polynucleotide is useful for expressing CCP protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and to modulate CCP activity. The present sequence represents a CCP protein of
                                                                                                                                                                                                                                                                                                                                                                                      the invention

2003-248221/24. WPI; 2003-248221/ N-PSDB; ADD30431. New plant transcription factor polynucleotides and polypeptides, useful in producing transgenic plants with commercially valuable properties, such as an alteration in a plant growth characteristic, e.g. growth rate

Disclosure; SEQ ID NO 461; 454pp; English.

The invention relates to a number of isolated Arabidopsis thaliana cDNA sequences and their encoded proteins which are especially transcription factor related cDNA's and proteins. The isolated or recombinant plant transcription factor polynucleotides and polypeptides are useful in producing transgenic plants with commercially valuable properties, i.e. modified or altered desirable traits as compared to a reference plant,

such as an alteration in a plant growth characteristic, e.g. growth rate,
                                                                                                                                                                                                                                                                                                                    Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
        germination rate of seeds, vigor of plants and seedlings, or leaf and flower senescence. Sequence information related to the polymucleotides and also be used in boinformatic search methods. The transgenic plant is useful for growing a progeny plant from a parent plant. This sequence represents one of the proteins of the invention.

```
The invention relates to a novel cell cycle protein (CCP) and the polymorleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP modelet and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat clastoctarised by insufficient or excessive production of CCP protein or production of CCP protein forms which have decreased or berrant activity. Compounds that bind to or modulate the activity of CCP protein forms which have decreased or polymorleotide are useful as herbicides or plant growth regulators. The polymorleotide is useful for modifying cell fate, plant development, of cell civile or production, plants of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, seed size, seed development, nobel function, dwarfism in plants, initiation and root initiation and/or development, notelle function, dwarfism in plants, sensessice or seeds.
                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cell cycle protein; CCP; cell cycle regulation; herbicide; plant growth regulator; plant development; abiotic stress; biotic stress; nutrient deprivation; pathogen attack; crop yield; immunogen.

involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to novel human diagnostic and therapeutic polymucleotides designated dithp (ACC46080-ACC46749) and to their encoded portucines DITHP; ARR4118-ARR41812). The invention also relates to polymucleotide sequences at least 90% identical to the dithp cDNA sequences of the invention; recombinant vectors, host cells and comparison comprising dithp mucleic acid sequences; the recombinant production of DITHP proteins; antibodies specific for DITHP proteins; antibodies specific for DITHP proteins; methods of sessing the toxicity of test compounds using a dithp hybridisation of probe. Dithp nucleic acid sequences and DITHP proteins may be used in the diagnosis of a wide variety of conditions including cancer and other cell compounds with a wide variety of conditions including cancer and other cell grobe. Dithp nucleic acid sequences and DITHP proteins may be used in the probe. Dithp nucleic acid sequences and DITHP proteins may be used in the proliferative disorders; autoimmune or inflammatory disorders; metabolic confiscative disorders; mucrological disorders; promerial disorders; metabolic disorders; and connective tissue disorders; metabolic disorders; and connective tissue disorders. They may also be used to screen for modulators of protein activity or gene expression. DITHP conteins can additionally useful in somatic or garmline gene therapy of the disorders additionally useful in somatic or garmline gene therapy of the disorders concell type and to induce antibodies. The dithp nucleic acids at source of probes and primers, in genotyping and identification of individuals, in the generation of transgenic animal models of human disease or knock in humanised animals, in toxicological testing, and in transcript imaging. The present sequence expresents a DITHP protein was obtained in electronic format cigaralling activity. Note: The sequence data for this parent did not form signalling activity. Note: The sequence additionally protein and protein additionally but was obtained in electronic formating ac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps

                                                                                                                                       New antiviral agent disrupting binding of VP22 to VP16 or gB - useful for treating infections caused by herpes simplex, e.g. cold sores and chicken
                                                                                                                                                                                                          The present sequence is a herpes simplex virus (HSV) truncated tegument protein VP22 derived peptide. VP22 was used in the preparation of a novel mativiral agent, which inhibits the maturation and/or replication of HSV by disrupting association between VP22 and VP16 and/or gB. The agent can be used to treat, e.g. cold sores, genital herpes, chickenpox and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders
       New antiviral agent disrupting binding of VP22 to VP16 or gB - useful for treating infections caused by herpes simplex, e.g. cold sores and chicken
                                                                                                                   The present sequence is the herpes simplex virus (HSV) truncated tegument
                                                                                                                                                                       рe
                                                                                                                                protein VP22. VP22 was used in the preparation of a novel antiviral agent, which inhibits the maturation and/or replication of HSV by disrupting association between VP22 and VP16 and/or gB. The agent can be used to treat, e.g. cold sores, genital herpes, chickenpox and shingles
                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, chromosome mapping, gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                    0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a peptide which was used to form a linker between chimaeric proteins consisting partially of the hepatitis C virus core protein. The core protein has been shown to be localised to lipid droplete within cells. This means that fragments of the protein, in particular those comprising amino acids 125-144 or 161-166, can be used to target proteins to lipid droplets in milk. This provides a simple and efficient means of obtaining proteins of interest, using transgenic animals. Proteins of interest include those implicated in disease and antigenic polypeptides for use as vaccines

This sequence represents a novel method for stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to an antigen (I). The method comprises (i) dividing the amino acid sequence of the antigen into protein fragments (II) of at least 9 amino acids whereby adjacent or neighbouring fragments are in the whole antigen sequence; (ii) synthesizing a peptide library containing (II); and (iii) incubating the CD8 and/or CD4 T lymphocytes in a suspension comprising (II) in a single culture vessel. The method is used to immunoserializate T cells of mammals, particularly humans, and is also useful for diagnostic purposes to determine if a mammal, especially human, has previously immunologically responded to a specific protein, and to determine strength of that response. The method is suitable for in vivo or in vitro immuno-stimulation of mammalian, more preferably human T imphocytes, where the stimulated T lymphocytes are expanded and can be transfused into a partient. ABBS654-ABB8681 represent fragments of the human cycomegalovirus IE1 and pp65 lower matrix phosphoprotein which are used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HSV; tegument protein; VP22; UL49; antiviral agent; treatment; cold sore; genital herpes; chickenpox; shingles.
                                                                                                                                                                                                                                                                                                                                                                              Stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to the antigen comprises using a synthetic peptide library of the specific antigen.

and there is no native expression of endogenous CAP1 is a serine protease
and there is no native expression of endogenous CAP1 gene. Transgenic
mice with a heterologous disruption in the CAP1 gene exhibit an increased
susceptibility to seizures which are similar to epilepsy. Disclosed is a
method for producing the transgenic mouse with a disruption in the CAP1
gene which contains a targeting construct comprising a first or second
polynucleotide sequence homologous to at least a first or second portion,
respectively, of the CAP1 gene and a selectable marker. Also disclosed
are methods for identifying an agent that modulates susceptibility to
seizure or the phenotype, for identifying a potential therapeutic agent
correction appliepsy, for evaluating a potential therapeutic agent
capable of affecting a condition associated with a mutation in a CAP1
gene (e.g. a CAP1 agonist) and for determining whether an agent modulates
a CAP1 serine protease. The transgenic mouse, comprising a disruption in
a CAP1 gene, is useful for preparing a pharmaceutical composition for
treating epilepsy. The sequence presented is the mouse CAP1 protein
                                                                                                          The invention discloses a new transgenic mouse comprising a disruption in

The Bimeria acervulina 200 kD antigen, recombinant vector viruses or host cells are used to produce vaccines to protect avians against coccidiosis particularly chickens. The waccine can also contain immunogens related to other pathogens found in poultry or may contain nucleic acid encoding them e.g. antigens of Marek's Disease virus, Newcastle Disease virus, Chicken Anaemia Agent, Reo virus, Infectious Bursal Disease virus, Chicken Anaemia Agent, Reo virus, E. Coli or other Eimeria species to produce a multivalent vaccine. The nucleic acids are useful as hybridisation probes to isolate sequences encoding functional variant proteins e.g. from tissues or a cDNA library from a specific Bimeria strain. The nucleic acid is additionally used in test kits for diagnosis of Eimeria cleic infections and in immunoassays. (Updated on 25-WAR-2003 to correct PF field.) The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the geneme of P. luminescens and related species, to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the colypoptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that corresponse or sensitivity to toxins and antibiotics produced by P. capponse or sensitivity to toxins and antibiotics produced by P. combinant production of the proteins, particularly toxins and crecombinant vectors containing the genes and Ab are also useful crecombinant production singettion by bacteria or fungithat are sensitive to P. luminescens-encoded toxins or antibiotics) and as compensationes. Other uses of the genes and the proteins are very constructions. This sequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Virucide, immunostimulant; cytotoxic T-lymphocyte, CTL; epitope; antigen; human cytomegalovirus; HCMV; pp28; pp50; pp65; pp71; pp150; gB; gH; IE-1; IE-2; US2; US3; US6; US11; UL18; cytomegalovirus infection; pregnancy;

The invention relates to a novel isolated peptide comprising one or more cytotoxic T-lymphocyte (CTL) epitope(s) of the same or different antigen of a human cytomegalovirus (HCMV). The HCMV antigens can comprise pp28, pp50, pp65, pp71, pp150, gB, gH, IE-1, IE-2, IG2, US2, US3, US6, US11 or UL18. The peptide comprises a sequence of about 9-20 contiguous amino acids of treating cytomegalovirus infection in humans, and in monitoring immune responses in various clinical settings (e.g. transplantation or pregnancy). This sequence represents a human cytomegalovirus CTL epitope peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mouse, enzyme; transgenic; channel activating protease 1; CAP1; serine protease; seizure; epilepsy; therapeutic; agonist; anticonvulsant.
                                                                                                                                                                                                                                                                                                                                                                                     for diagnosing, preventing or treating CMV infection, comprises pp28, pp50, pp65, pp71, pp150, gB, gH, IE-1, IE-2, US2, US3, US6, US11 or UL18.
                                                                                                                                                                                                                                                                                                                                                      New human cytomegalovirus (CMV) cytotoxic T-cell epitope peptide, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

The invention relates to a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal comprising administering directly to the lymphatic system of the mammal:

(a) an antigen in the form of a polypeptide; (b) a vector comprising a nucleic acid encoding the antigen; or (c) a non-peptide antigen. The method is useful for treating and/or sustaining CTL response in a mammal. This is particularly useful for treating a mammal having a malignant tumnour (e.g. carcinoma, melanoma, leukaemia or lymphoma) or infectious disease (e.g. hepatifits, acquired immune deficiency syndrome (AIDS), malaria, measles or tuberculosis), or in an animal having a predisposition to these diseases. The mammal may be dogs, cats, mice, cattle, sheep, pigs, goats, rabbits, or preferably humans. ABG79753-ABG80119 represent viral epitopes on major histocompatibility complex (MHC) class I molecules, used in the method of the invention

The HCMV antigens can comprise pp28, pp50, pp55, pp71, pp150, pg 9H, IE-1, IE-2, US2, US3, US6, US11 or UL18. The peptide comprises a sequence of about 9-20 contiguous amino acids of the antigen. The peptide epitopes are useful in diagnosing, preventing or treating cytomegalovirus infection in humans, and in monitoring immune responses in various clinical settings (e.g. transplantation or pregnancy). This sequence represents a human cytomegalovirus CTL epitope peptide of the invention

The invention relates to immunologically active peptides, and functional variants thereof, capable of eliciting a cellular immune response to human cytorhegalovitus (HCMV) in humans. The peptides are capable of directing human cytotoxic I lymphocytes (CTL) to recognise and lyse human call infected with HCMV. Such immunologically active peptides, in association with an major histocompatibility complex (HHC) class I (inactive) HCMV infection. Vaccines of individuals having a latent (inactive) HCMV infection. Vaccines comprising these peptides are useful for activating CTLs and CTL precursors (CTLp), particularly for eliciting a cellular immune response against HCMV by normal and immunodeficient subjects. The peptides may be used in an assay for determining the degree of immunostimulation caused by HCMV. The peptides may also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           distinguishing individuals who are seropositive from those who have not been exposed to HCMV (seronegative individuals). The present peptide sequence is a cytotoxic epitope variant from human cytomegalovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New peptides that are immunogenic epitopes of the human cytomegalovirus (CMV), useful for activating cytotoxic T lymphocytes (CTL) or CTL precursors to elicit an immune response against human CMV by normal or immunodeficient subjects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human cytomegalovirus, HCMV, cytotoxic epitope, infection, vaccine, cytotoxic T lymphocyte, CTL, CTL precursor; CTLp, Class I antigen, emajor histocompatibility Complex, MHC, cellular immune response; CTL activator; 
                                                                                                                                                                                                                                                                                                                                                                                                                 Human cytomegalovirus (HCMV) cytotoxic epitope variant #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              90.6%; Score 48; DB 4; Length 10; 100.0%; Pred. The invention relates to immunogenic peptides derived from human cytomegalovirus (HCMV) which are recognised by human cytotoxic T-Iymphocytes (CTL). The invention also discloses a vaccine against HCMV comprising one of the peptides, and a pharmaceutically acceptable carrier, a cellular vaccine against HCMV comprising antigen presenting cells that have been treated in vitro so that they express the peptide, and a recombinant viral vector vaccine expressing a gene encoding the peptide. The vaccine is used to modulate the immune response to human cytomegalovirus infection. HCMV is implicated in a number of diseases and conditions including restenosis after coronary angioplasty, morbidity/mortality in AIDS (acquired immunodeficiency syndrome) patients, viral retinitis leading to blindness, encephalitis, enterities, morbidity/mortality in AIDS (acquired immunodeficiency syndrome) carcomal and post-bone marrow transplant complications. The present sarcomal and post-bone marrow transplant complications. The present services.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic peptides useful as a vaccination against cytomegalovirus infection, comprises epitopes of human cytomegalovirus which are recognized by human cytotoxic T-lymphocytes.
                                                                                                                                                                                                                                                                           Immunogenic epitope; pp65; cytotoxic T cell; CTL; HCMV; vaccine; virucide; restenosis; coronary angioplasty; morbidity; mortality; AIDS; acquirted immunodeficiency syndrome; viral retinitis; blindness; encephalitis; enteritis; monucleosis; interstitial pneumonia; malignancy; Karposi's sarcoma; post-bone marrow transplant complication.
                                                                                                                                                                                                                                            Human cytomegalovirus pp65 protein based immunogenic epitope #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             90.6%; Score 48; DB 5; Length 10; 100.0%; Pred. Human cytomegalovirus immunogenic peptide SEQ ID NO:8.

(first entry)

20-OCT-2000

AAB12413;

AAB12413 standard; peptide; 10 AA.

RESULT 18

```
cytocoxic T lymphocytes. The antigen presenting cells primed with the IAPs can be used as diagnostic reagents to detect immunostimulation by HCMV. They can also detect active HCMV infection or exposure to HCMV. HCMV can cause opportunistic infections resulting in a variety of complications in, e.g. immunosuppressed patients. The IAP vaccines impart immunity to bone marrow transplant recipients, solid organ recipients, heart patients, AIDS patients or women of child-bearing years, without the need for ex vivo expansion of HCMV-specific cytocoxic T lymphocytes (which requires sophisticated laboratory setup and is highly labor-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes immunologically active peptides (IAPS) capable of eliciting a cellular immune response to human cytomegalovirus (hCMY). The IAP can be used in a (cellular) vaccine to augment the immune system response to HCMV, or to provide immunity against HCMV. The IAP (cellular) vaccine can also protect an individual having a latent HCMV infection from reactivation. An antigen presenting cell can be used to determine the presence or absence of HCMV-infected Ilymphocytes. The viral vector containing IAP encoding DNA can also be used to provide immunity against HCMV. The IAP can be used to prepare HCMV-reactive human

The present invention describes a cellular vaccine (I), which elicits a mHC Class I cellular immune response to human cytomegalovirus (HCWV), and comprises a peptide selected from (i) - (V), provided that (i) is not another peptide (vi): (i) Ann Xaal Val Pro Met Val Pro Kaa2; (ii) Tyr Caa3 (Glu His Pro Thr Pro Arg Val Pro Met Val Pro Lys Asa (V) Phe Ca Thr Lys Asp Val Ala Leu, where Xaal = Leu, Ile, Met, Thr or Lys Asp Val Ala Leu, where Xaal = Leu, Ile, Met, Thr or Val; Caa2 = Val, Ala, Cys, Ile, Leu or Thr; Xaa3 = Ser, Thr or Leu; Xaa4 = Val Cor Thr; Xaa5 = Leu, Arg or Lys; Xaa6 = Leu, Met or Phe; and (i) is not cor Thr; Xaa5 = Leu, Arg or Lys; Xaa6 = Leu, Met or Phe; and (i) is not cor Thr; Xaa5 = Leu, Arg or Lys; Xaa6 = Leu, Met or Phe; and (ii) is not cor Thr; Man Pro Met Val Ala Thr Val (vi). The peptides are useful for providing immunity against future infections by HCMV, and for augmenting cor the immune reaponse of an individual who is latently infected with HCMV and is at risk for reactivation of HCMV infection. The peptides are also useful for imparting immunity to a bone marrow transplant recipient, a solid organ recipient, a heart patient, an Albs patient or a woman of confid-bearing years, without the need for ex vivo expansion of HCMV specific CTL in vitro, thus can be used in an assay to determine the capendary or an interval and those who have not been core exposed to HCMV and in the study of the Class I antigen-processing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New immunogenic peptides useful for providing immunity against cytomegalovirus (CMV) infections, are capable of eliciting cellular

stimulate T cells of mammals, particularly humans, and is also useful for diagnostic purposes to determine if a mammal, especially human, has previously immunologically responded to a specific protein, and to determine strength of that response. The method is suitable for in vivo or in vitro immuno-stimulation of mammalian, more preferably human T lymphocytes, where the stimulated T lymphocytes are expanded and can be transfused into a patient. AAB86544-AAB86803 represent fragments of the human cytomegalovirus IEI and pp65 lower matrix phosphoprotein which are used to illustrate the method of the invention

Ramon A;

WPI; 1997-435169/40. N-PSDB; AAT79194. Combined antigen containing parts of 3 human cytomegalovirus proteins useful for early detection of virus specific antibodies and in preventative vaccines.

Example 4; Page 21; 26pp; English.

The present sequence represents a human cytomegalovirus combined antigen, which contains amino acid sequences from at least 3 human cytomegalovirus (hcWv) proteins and has an increased ability to bind hcWv specific antibodies (Ab). The device is used to detect and quantify Ab, particularly of immunoglobulin A (IgA) type, in human body fluids and tissues. The antigen is also used in vaccines for protection against diseases caused by hcWv and to generate Ab for hcWv detection. The combined antigen can detect hcWv infection at an early stage (allowing early treatment), since sensitivity and accuracy are improved by the interaction of immunodominant regions of early formed proteins present in a single antigen (the combine antigen's Ab binding ability is 2-3 times greater than for single antigens). The combined antigen also avoids the lack of antigen standardisation which limits use of conventional assay systems

Sequence variants of the present peptide are recognised by the CDB+ class I major histocompatibility complex (MHC) restricted cytotoxic T-lymphocytes of patients harboring latent HCWV infection. The peptides are claimed to be capable of activating cytotoxic T-cell lymphocytes in the absence of active viral replication, and thus are useful for eliciting a cellular immune response against HCMV by normal and

This sequence comprises the full-length human cytomegalovirus (HCMV) Towne strain tegument phosphoprotein pp55; the strain AD169 pp65 sequence is given in AAW26732. The invention provides DNA molecules (see AAF12180-813 and AAT99436) useful for in vitro and in vivo expression of antigenic fragments of the HCMV genome. Preferred antigens include full-length and transmembrane-deleted fragments of gB (see AAW27274) such as gB1-6B0, phosphoprotein pp65 (see AAW27276) phosphoprotein pp65 (see AAW27277) and the Ir-exon 4 product (see AAW27275). The DNA molecule is preferably in the form of a plasmid and includes a regulatory sequence for expressing the antigen in mammals, where the antigen elicits an immune response. The products can induce HCMV-specific immune responses including neutralising antibodies and cytotoxic I lymphocytes and can be used for the prevention and treatment of HCMV infections
New human cytomegalovirus DNA constructs - encode a HCMV antigen to induce an immune response, used for the treatment and prevention of HCMV infection.
                                                                                                                                                                                                                                                   Example 3; Fig 5; 66pp; English.

vaccines and to expand immune effector cells which are specific for viral infections characterized by expression of cytomegalovirus antigen pp65. Novel synthetic antigenic compounds useful as components of antiviral

This sequence represents a novel method for stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to an antigen (I). The method comprises (i) dividing the amino acid sequence of the antigen into protein fragments (II) of at least 9 amino acids, whereby adjacent or neighbouring fragments are in the whole antigen sequence, (ii) synthesizing a peptide library containing (II); and (iii) incubating the CD8 and/or CD4 T lymphocytes in a suspension comprising (II) in a single culture vessel. The method is used to immuno-

cytomegalovirus antigen constructerised by expression of COMP.

Cytomegalovirus antigen pp65. Antigenic compounds are useful for immunotherapy and also for inducing an immune response in a subject. The antigenic compound is useful for addilating immune response to the cartigenic compound is useful for addilating immune response to the cognate native ligands and their corresponding native proteins, and is useful as compounds and their corresponding native proteins, and is capanding immune effector cells that are specific for viral infections characterised by expression of CMV antigen pp65. Furthermore, the cartigenic compound also has diagnostic applications. The DNA encoding the antigenic compounds are useful as probes and primers for detecting genes antigenic compounds are useful as probes and primers for detecting genes or gene transcripts that are expressed in antigen presenting cells (APC), to confirm transduction of the polynuclectides into host cells and also in gene therapy techniques for treating cancer. The antigenic compounds immune receptor cell is also useful as vaccines. The antigenic compounds condition their DNAs are useful for preparing medicaments for diseases such as cancer. The present sequence is native CMV antigen pp65 protein

The HCMV antigens can comprise pp28, pp50, pp65, pp71, pp150, gB, gH, IE-1, IE-2, US2, US3, US6, US1 or UL18. The peptide comprises a sequence of about 9-20 contiguous amino acids of the antigen. The peptide epitopes are useful in diagnosing, preventing or treating cytomegalovirus infection in humans, and in monitoring immune presponses in various clinical settings (e.g. transplantation or prepanancy). This sequence represents a human cytomegalovirus CTL epitope peptide of the invention

AD169 strain tegument phosphoprotein pp55; the strain Towne pp65 sequence is given in AAW27276. The invention provides DNA molecules (see AAF91280-83 and AAF99436) useful for in vitro and in vivo expression of antigenic tragments of the HCMV genome. Preferred antigens include full-length and transmembrane-deleted fragments of g8 (see AAW27274) such as g81-680, phosphoprotein pp65 (see AAW27276 and AAW27275). The Dp50 (see AAW27277) and the IE-exon 4 product (see AAW27275). The DNA molecule is preferrably in the form of a plasmid and includes a regulatory sequence for expressing the antigen in mammals, where the antigen elicits an immune response. The products can induce HCMV-specific immune responses including neutralising antibodies and cytocoxic Tlymphocytes and can be used for the prevention and treatment of HCMV infections
                                                                                                                                                                             New human cytomegalovirus DNA constructs - encode a HCMV antigen to induce an immune response, used for the treatment and prevention of HCMV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                         This sequence comprises the full-length human cytomegalovirus (HCMV)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HCMV; CMV; antigen; infection; therapy; vaccine; tegument protein;

This sequence represents a novel method for stimulating CDB or CD4 T cells for the immuno-stimulation of mammals and the determination of the cells for the immuno-stimulation of mammals and the determination of the cais sequence of the antigen into protein fragments (II) of at least 9 amino acids, whereby adjacent or neighbouring fragments are in the whole amino acids, whereby adjacent or neighbouring fragments are in the whole antigen sequence; (ii) synthesizing a peptide library containing (II); and single culture vessel. The method is used to immunocytising (II) in a single culture vessel. The method is used to immunocytismulate T cells of mammals, particularly humans, and is also useful for diagnostic purposes to determine if a mammal, especially human, has previously immunologically responded to a specific protein, and to determine strength of that response. The method is suitable for in vivo determine strength of that response. The method is suitable for in vivo or in vitro immuno-stimulation of mammalian, more preferably human T cells in the stimulation of mammalian, more preferably human T cells in the stimulation of mammalian of the stimulation of mammalian of the transfused into a patient. Alabes644—Alaba86903 represent fragments of the human cytomegalovirus IEI and pp65 lower matrix phosphoprotein which are the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to the antigen comprises using a synthetic peptide library of the specific antigen.
                                                                                                                                                                                                                                                                                                                                                                                                               Antigen-specific stimulation; T-lymphocyte; CD8 stimulation; pp65;
CD4 stimulation; immuno-stimulation; IB1; lower matrix phosphoprotein.
                                                                                                                                                                                                                                                                                                                                                                 Human cytomegalovirus strain AD169 pp65 peptide fragment SEQ ID 130.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Khatamzae

This sequence represents a novel method for stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to an antigen (I). The method comprises (i) dividing the amino caid sequence of the antigen into protein fragments (II) of at least 9 caid sequence of the antigen into protein fragments are in the whole antigen sequence, (ii) synthesizing a peptide library containing (II); comprising (II) in a single culture vessel. The method is used to immunocomprising (II) in a single culture vessel. The method is used to immunocomprising (II) in a single culture vessel. The method is used to immunocomply immunologically particularly humans, and is also useful for diagnostic purposes to determine if a mammal, especially human, has considered into immuno-stimulation of mammalian, more preferably human T con in vitro immuno-stimulation of mammalian, more preferably human T con in vitro immuno-stimulation of mammalian, more preferably human T con in vitro immuno-stimulated T lymphocytes are expanded and can be transfused into a patient. AAB86544.AAB86803 represent fragments of the human cytomegalovirus IEI and pp65 lower matrix phosphoprotein which are used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stimulating CD8 or CD4 T cells for the immuno-stimulation of mammals and the determination of the response to the antigen comprises using a synthetic peptide library of the specific antigen.
                                                                                                                         Antigen-specific stimulation; T-lymphocyte; CD8 stimulation; pp65; CD4 stimulation; immuno-stimulation; IE1; lower matrix phosphoprotein.

related Kaposi's sarcoma, sarcomas, osteosarcoma, renal carcinoma, and haematopoietic malignant tumours such as leukaemia and lymphoma. The aptitope is an HIA, (human leukocyte antigen) peptide derived from a viral orlumour antigen. The present sequence is a viral HIA epitope used in the fusion proteins of the invention

ö

```
New polynucleotide capable of expressing an epitope-beta2m fusion protein useful for generating cytotoxic I lymphocyte responses against a tumor and in restoring antigen presentation in the tumor of a host.
sequence is an HCMV pp65 protein immunogenic epitope upon which vaccines and peptides of the invention are based

The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a monogene antigen, a multilineage antigen, an embryonic antigen, an oncogene antigen, a multated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of antigen, or a viral antigen. They can be used for the treatment of antigen, or a viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes blace in the milieu of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAY10071 to AAX10639 represent examples of peptide antigens

Sequence 15 AA;

The invention relates to a new polynuclectide capable of expressing an epitope-beta 2m fusion protein useful for generating cytotoxic T

Tymphocyte (CTL) responses against a tumour or in restoring antigen to presentation in the tumour of a host. Also included are a polynuclectide capable of expressing an epitope-beta 2m fusion protein in combination with a vaccination agent that stimulates a CTL response against the epitope of the fusion protein for simulates a CTL response against the use in the treatment of cancer and a method of treating a tumour by administering a capable of expressing an epitope-beta 2m fusion protein, and optionally a vaccination agent that stimulates a CTL response against the epitope of the fusion protein. The polynucleotide is useful for the epitope of the fusion protein. The polynucleotide is useful for generating CTL responses against tumours, for restoring antigen protein in the tumour, and subsequently for treating cancers, such as gastrointesfriant unmour, protatic, testicular, lung or breast cancer, malignant melanoma, mesothelioma, brain tumour, ovarian cancer, uterine cancer including cervical cancer, cancer of the head and neck, bladder cancer, Kaposi's sarcoma, AIDS (acquired immunodeficiency syndrome)-

New peptides that are immunogenic epitopes of the human cytomegalovirus (CMV), useful for activating cytotoxic T lymphocytes (CTL) or CTL precursors to elicit an immune response against human CMV by normal or WPI; 2001-431950/46. Diamond DJ, AAE05431; (YORK/) Matches 8888888888888888 δ

ö useful for imparting immunity to a bone marrow transplant recipient, a solid organ recipient, a heart patient, an AIDS patient or a woman of child-bearing years, without the need for ex vivo expansion of HCWV-specific CTL. These peptides can directly stimulate cytotoxic T lymphocytes (CTL) in vitro, thus can be used in an assay to determine the degree of immunostimulation caused by HCMV. These may also be used to distinguish individuals who are seropositive from those who have not been exposed to HCMV and in the study of the Class I antigen-processing pathway for HCMV proteins. The present sequence represents a peptide used in the exemplification of the present invention and is at risk for reactivation of HCMV infection. The peptides are also useful for imparting immunity to a hone marrow transfort to a hone marrow transfort. 0; Gaps Human cytomegalovirus; HCMV; cytotoxic epitope; infection; vaccine; cytotoxic T lymphocyte; CTL; CTL precursor; CTLp; Class I antigen; major histocompatibility complex; MHC; cellular immune response; CTL activator; CTLp activator; immunostimulant. The invention relates to immunologically active peptides, and functional variants thereof, capable of eliciting a cellular immune response to thuman cytomegalovirus (RFMV) in humans. The peptides are capable of directing human cytocoxic T lymphocytes (CTL) to recognise and lyse human cells infected with HCMV. Such immunologically active peptides, in association with an major histocompatibility complex (MHC) class I molecule, are recognised by CTEs of individuals having a latent (inactive) HCMV infection. Vaccines comprising these peptides are useful

Claim 9; Page 49; 56pp; English.

The present peptide is an immunogenic epitope which is recognised by the CD8+ class I major histocompatibility complex (MHC) restricted cytotoxic T-lymphocytes of patients harboring latent HCMV infection. The peptide is claimed to be capable of activating cytotoxic T-cell lymphocytes in the absence of active viral replication, and thus is useful for eliciting a cellular immune response against HCMV by normal and immunodeficient subjects. The immunological peptide can also be formulated as a vaccine which is claimed to be useful for protecting against HCMV infection, augmenting the immune system response to a HCMV infection, against reactivation of a latent HCMV infection

The peptides are useful for providing immunity against future infections by HCMV, and for augmenting the immune response of an individual who is latently infected with HCMV
                                                                             HCMV can cause opportunistic infections resulting in a variety of complications in, e.g. immunosuppressed patients. The IAP vaccines impart immunity to bone marrow transplant recipients, solid organ recipients, heart patients, AIDS patients or women of child-bearing years, without the need for ex vivo expansion of HCMV-specific cytotoxic T lymphocytes (which requires sophisticated laboratory setup and is highly labor-
immunity against HCMV. The IAP can be used to prepare HCMV-reactive human
               cytotoxic T lymphocytes. The antigen presenting cells primed with the IAPs can be used as diagnostic reagents to detect immunostimulation by HCMV. They can also detect active HCMV infection or exposure to HCMV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New immunogenic peptides useful for providing immunity against cytomegalovirus (CMV) infections, are capable of eliciting cellular

Sequence 207115, Application US/10424599

Publication No. US20040031072A1

GENERAL INFORMATION:

APPLICANT: La Rosa Thomas J

APPLICANT: Cao Yongwel

TITLE OF INVENTION: Soy Nucleic Acid Molecules and Other Molecules Associated With

TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement

TITLE OF INVENTION NUMBER: US/10/424,599

CURRENT APPLICATION NUMBER: US/10/424,599

CURRENT FILING DATE: 2003-04-28

NUMBER OF SEQ ID NOS: 285684

SEQ ID NO 207115
